RESEARCH & TEACHING INTERESTS

My research focuses on the biology of genomic conflicts and what they can tell us about the evolution of conflict and cooperation more generally. I develop population genetic theory and perform comparative analyses to ask how and why such conflicts occur and how they fit into models of social evolution. I am also currently writing the first book-length treatment of the history and current state of the so-called gene's-eye view of evolution, also known as selfish gene theory. Tentatively titled *The Gene's-Eye View: How to Think like a Selfish Gene*, it is scheduled to be published by Oxford University Press in 2021.
